E-mail: taoruyi@mail.bnu.edu.cn

School of Systems Science, Beijing Normal University

Research Interests: Complex System Modeling,

Scaling Laws, Growth Dynamics

Homepage: <https://try6.github.io/>

EXPERIENCE

Beijing Institute of Mathematical Sciences and Applications(BIMSA): Visiting Scholar, 2026.5-present

Sante Fe Institute: Visiting Scholar, 2024.6-2024.9

Beijing Normal University, Systems Science: Ph.D. Candidate., 2021-present

Hangzhou Dianzi University,Digital Media Technology: Bachelor., 2013-2017

PUBLICATIONS

- **R Tao, W Kai, J Xu, V. R. Cappelli, J Zhang. Predicting Company Growth using Scaling Theory Informed Machine Learning. *npj Complex* (2026).**

We propose a Scaling-Theory-Informed Machine Learning (STIML) framework that integrates a scaling-based growth model to capture the mechanism-driven average trend, together with a data-driven forecasting model to learn the residual fluctuations. Our model captures both the intrinsic growth mechanisms and the fluctuations, demonstrating superior predictive performance compared with methods that use time series techniques alone.

We develop a scaling framework that focuses on company size as the critical feature determining a variety of tradeoffs, and use this to reveal novel systematic behavior across the diversity of publicly-traded companies. Our model produces predictions that are in good agreement with data for the US, China and Europe market, and we observe that, on average, in both countries sales scale sublinearly with assets and exhibit nearly identical exponents leading, surprisingly and nontrivially, to assets that grow as a power law in time rather than exponentially, as often assumed.

- **R Tao, N Tao, Y You, J Zhang. Data driven modeling of self-similar dynamics. *Physica D: Nonlinear Phenomena*, 2025, 472: 134505.**

We introduce a multiscale neural network framework that incorporates self-similarity as prior knowledge, facilitating the modeling of self-similar dynamical systems. The framework allows us to extract scale-invariant kernels from the dynamics for modeling at any scale and identify the power-law exponents in self-similar systems
